

Tools Function Programming

It allows automating the program's functions by chaining them together to be executed sequentially without manual intervention.

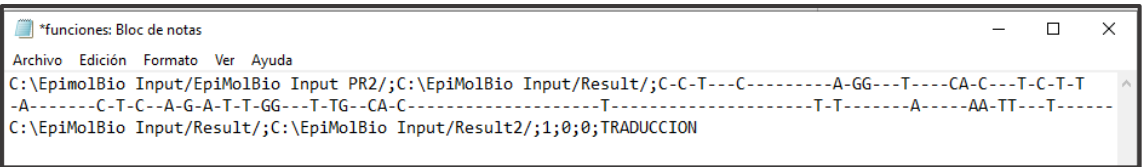

① The input file should be a .txt file containing the instructions that this tool will automatically carry out:

To create it, select the first function you want to automate, fill in all the fields except for input and output, and press the function programming button. Copy the generated content into a .txt file.

Replace ENTRADA (CARPETA)/INPUT (FOLDER) with the path to the folder containing the files to be analyzed.

Replace SALIDA (CARPETA)/OUTPUT (FOLDER) with the path to the folder where you want to save the result of the first function.

The following instructions should start on a new line of text. To chain functions, use the output of the previous function as the input.

② Select the " Function Programming " box.

③ Click Calculate.

It is not always necessary to chain the functions; independent functions can also be automated. For example, automating the outputs of several .html files. In this case, the input will not be the output from the previous line, but rather a separate input.

More information about this function can be found in the User Manual, section:
